COMPLETE LISTING OF ALL OF THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

Claim 1 (original): A method to assemble a pre-curved bolster plate to one side of a substrate having a first side and a second side, comprising:

attaching a component to an electrical contact area on said first side of said substrate; and

attaching said pre-curved bolster plate on said second side of said substrate, wherein said pre-curved bolster plate is attached to said second side opposite said electrical contact area on said first side of said substrate.

Claim 2 (original): The method of claim 1, wherein said component is a land grid array (LGA) component.

Claim 3 (original): The method of claim 1, wherein said substrate is selected from a group of substrates consisting of: a printed circuit board (PCB), a multi-chip module (MCM), and a flexible substrate.

Claim 4 (original): The method of claim 1, wherein said precurved bolster plate includes a material selected from the group consisting of: a stainless steel alloy, a powder-coated spring steel alloy, a plated spring steel alloy, a painted spring steel alloy, a titanium steel alloy, a carbon steel alloy, a magnesium alloy, and an aluminum alloy.

Claim 5 (original): The method of claim 1, wherein said precurved bolster plate has a spherical curvature.

Claim 6 (original): The method of claim 1, wherein said precurved bolster plate has a cylindrical curvature.

Claim 7 (original): The method of claim 1, wherein said precurved bolster plate has a radius of curvature in excess of 100 inches (254 centimeters).

Claims 8-12 (previously cancelled)

Claims 13-20 (cancelled)

Claim 21 (new): A method for providing support to a substrate, the method comprising:

attaching a component to an electrical contact area on a first side of the substrate; and

attaching a pre-curved bolster plate on a second side of the substrate, the pre-curved bolster plate having a precalculated radius of curvature prior to attachment to the second side of the substrate.

Claim 22 (new): The method of claim 21, wherein the component comprises a land grid array (LGA) component.

Claim 23 (new): The method of claim 21, wherein the substrate is selected from a group of substrates consisting of: a printed circuit board (PCB), a multi-chip module (MCM), and a flexible substrate.

Claim 24 (new): The method of claim 21, wherein the precurved bolster plate includes a material selected from a group consisting of: a stainless steel alloy, a powder-coated spring steel alloy, a plated spring steel alloy, a painted spring steel alloy, a titanium steel alloy, a carbon steel alloy, a magnesium alloy, and an aluminum alloy.

Claim 25 (new): The method of claim 21, wherein the precurved bolster plate has a spherical curvature.

Claim 26 (new): The method of claim 21, wherein the precurved bolster plate has a cylindrical curvature.

Claim 27 (new): The method of claim 21, wherein the precurved bolster plate has a radius of curvature in excess of approximately 100 inches (254 centimeters).

Claim 28 (new): A substrate support assembly produced in accordance with the method of claim 21.

Claims 29-36 (cancelled)

Claim 37 (new): A method for coupling a plate member to an electrical packaging assembly, the method comprising:

providing an electrical packaging assembly;

disposing a plate member against the electrical packaging assembly;

flexing the plate member towards the electrical packaging assembly to produce a flexed plate member; and

coupling the flexed plate member to the electrical packaging assembly.

Claim 38 (new): The method of Claim 37 wherein said flexing comprises flexing opposed ends of the plate member towards a substrate of the electrical packaging assembly.

Claim 39 (new): The method of Claim 37 wherein said flexing comprises flexing opposed ends of the plate member towards a substrate of the electrical packaging assembly until the plate member is generally flushed against the substrate.

Claim 40 (new): The method of Claim 37 wherein said electrical packaging assembly comprises an electrical component having a plurality of leads attached to an electrical contact area of a substrate.

Claim 41 (new): The method of Claim 39 wherein said electrical packaging assembly comprises an electrical component having a plurality of leads attached to an electrical contact area of said substrate.

Claim 42 (new): The method of Claim 37 wherein said plate member is stamped to achieve a spherical curvature.

Claim 43 (new): The method of Claim 41 wherein said plate member is stamped to achieve a spherical curvature.

Claim 44 (new): The method of Claim 37, wherein said plate member is fabricated from a material selected from the group of materials consisting of: a stainless steel alloy, a powder-coated spring steel alloy, a plated spring steel alloy, a painted spring steel alloy, a titanium steel alloy, a carbon steel alloy, a magnesium alloy, and an aluminum alloy.

Claim 45 (new): The method of Claim 43, wherein said plate member is fabricated from a material selected from the group of materials consisting of: a stainless steel alloy, a powder-coated spring steel alloy, a plated spring steel alloy, a painted spring steel alloy, a titanium steel alloy, a carbon steel alloy, a magnesium alloy, and an aluminum alloy.

Claim 46 (new): A method for assembling a bolster plate to a circuit member, the method comprising:

providing a circuit member;

disposing a bolster plate against the circuit member; flexing the bolster plate towards the circuit member to produce a flexed bolster plate; and

coupling the flexed bolster plate to the circuit member.

Claim 47 (new): The method of Claim 46 wherein said flexing comprises flexing opposed ends of the bolster plate towards the circuit member.

Claim 48 (new): The method of Claim 46 wherein said flexing comprises flexing opposed ends of the bolster plate towards the circuit member until the bolster plate is generally flushed against the circuit member.

Claim 49 (new): The method of Claim 46 wherein said circuit member includes an electrical contact area having a plurality of leads attached thereto.

Claim 50 (new): The method of Claim 48 wherein said circuit member includes an electrical contact area having a plurality of leads attached thereto.

Claim 51 (new): The method of Claim 46 wherein said bolster plate is stamped to achieve a spherical curvature.

Claim 52 (new): The method of Claim 50 wherein said bolster plate is stamped to achieve a spherical curvature.

Claim 53 (new): The method of Claim 46, wherein said bolster plate is fabricated from a material selected from the group of materials consisting of: a stainless steel alloy, a powder-coated spring steel alloy, a plated spring steel alloy, a painted spring steel alloy, a titanium steel alloy, a carbon steel alloy, a magnesium alloy, and an aluminum alloy.

Claim 54 (new): The method of Claim 52, wherein said bolster plate is fabricated from a material selected from the group of materials consisting of: a stainless steel alloy, a powder-coated spring steel alloy, a plated spring steel alloy, a painted spring steel alloy, a titanium steel alloy, a carbon steel alloy, a magnesium alloy, and an aluminum alloy.

Claim 55 (new): An assembly produced in accordance with the method of claim 46.
